Attachment to Control Device Entities Information
Comment Field for Combustor Information

The design inlet gas flow rate was not available from the manufacturer's information. However, the flow rate to the vapor combustor is only due to the displacement of vapor from filling tank trucks. The flow rate of 120 acfm was calculated based on a tank truck loading rate of 900 gallons per minute.

The inlet gas temperature was also unavailable. The inlet gas temperature will be at ambient conditions, estimated to vary from 0°F to 100°F.
