## Agenda

#	Topic	Speaker
<b>Permitting</b>		
1	<p>Matt Stanfield, TDES</p> <p>A facility is proposing to install a new flour mill and we wanted to ensure we're putting in the appropriate terms to ensure major source rules are not triggered for the facility. A determination for this facility was made that the baghouses used for flour milling are considered inherent to the process based on responses to the following questions:</p> <ol style="list-style-type: none"> <li>1. Is the primary purpose of the equipment to control air pollution? No</li> <li>2. Where the equipment is recovering product, how do the cost savings from the product recovery compare to the cost of the equipment? Savings of \$2.5 million/yr and control equipment cost of \$176,000.</li> <li>3. Would the equipment be installed if no air quality regulations are in place? Yes, since it captures at least 3.5% of the material that would be lost to atmosphere.</li> </ol> <p>The company is claiming 99.9% control efficiency for the 2 baghouses at the mill. At this level of control, emissions are estimated to be 2.8 tons/yr PE and 1.4 tons/yr PM10. Since the control is inherent to the process, the controlled emissions from the baghouse would be considered the uncontrolled emissions for purposes of determining potential to emit.</p> <p>Since the control equipment is considered inherent to the process, does Central Office consider an initial stack test at a point in the stack after the baghouse to determine the actual emissions rate that can be used for determining uncontrolled potential to emit without additional permit restrictions?</p>	Mike Hopkins
